STRENGTHENING BUSINESS CYBERSECURITY

Kampack is a packaging manufacturer in Newark, New Jersey. In 2018 Kampack was victim to a series of cyber attacks that left the company distraught and vulnerable. These attacks caused a crash in operations, preventing the company from executing payroll in time. Kampack found the help they needed to overcome these threats through Tekscape's Managed Service Cybersecurity Solution, Arma.

 The first cyber threat was executed as a crypto lock; it corrupted and locked computers, systems, and data. Even after paying the ransom, Kampacks' critical business data was still compromised. Kampack trusted their former IT Managed Service provider to clean up the damage from the attack to their overall technology infrastructure. After having been assured that the network and systems were remediated and protected, they experienced another instance of cyber attacks. **Looking for an IT partner with more experience in the cybersecurity space, Kampack found Arma to be their long-lasting solution.**

"Our work with Kampack happened at a critical moment for the business. Our understanding of cyber threats and the evolution of malware allowed us to run a full scan of their digital environment. We found new instances of malware that were ready to be triggered at a later point, which helped them identify new sources of breaches and remediate the issues. We were able to deploy our cybersecurity solution to protect endpoints for web security for 35 users" – **Arma Managed Services Team Lead**

Every day, midsized businesses like Kampack are falling victim to cyber threats due to a lack of cybersecurity enforcement. Capabilities like retrospective security allow Arma to continually monitor and analyze IT infrastructure while finding and remediating potential threats before they even occur. In addition, Arma's team of highly-specialized security engineers provides a full perspective to a cybersecurity strategy that includes technologies, policies, and world-class industry practices.
